

GRADED APPLICATION OF SYSTEMS ENGINEERING

The following matrix, presents a graded approach to applying the Systems Engineering process and developing SE products. This approach is designed to give Program Managers and supporting Systems Engineers direction as to the level of detail required to meet the guidelines of PRD-181 (Systems Engineering) and to satisfy the needs of a specific customer or project.

- **Level 3** utilizes high-level review of a particular problem and is tailored for those activities that must be done in an extremely short time frame or with a very small budget. As such, the products listed are created by completing pre-designed forms that represent a subjective record of the steps followed to reach a solution. A Project Manager (PM) should be able to use these forms and perform the necessary actions at this level.
- **Level 2** builds on Level 3 and is targeted at more complex efforts that require control of all documents and products generated. This level, however, does not require formal, documented reviews and baselines, but does control and track all data and decisions generated. Sufficient documentation is generated to provide objective, traceable and justifiable results. At this level, the PM is usually assisted by full or part time use of practicing Systems Engineers.
- **Level 1** extends the bounds of Levels 3 and 2 to include formal reviews, rigorous configuration management, and detailed system baselines. This extensive SE approach is targeted at those large-scale, complex programs that “must be right the first time.” For this comprehensive application, The PM typically employs a small group of dedicated Systems Engineers.

After identifying appropriate level(s) of SE products, the Systems Engineers and Program/Project Managers then complete the checklist on the following pages and identify the specific SE products to be generated and used. In addition, responsibilities for producing these products are assigned in the boxes indicated.

(The following responsibility abbreviations are used on the next two sheets: N/A–Not Applicable; PM–Program Manager; SE–Systems Engineer; PC–Project Controller; and TS–Technical Specialist.)

Project Structures SE Process Phases	Level 3: (least rigorous) Size: <5 people Complexity: Low Duration: <1 year Risk: Little to None Funding: < \$500K	Level 2: Size: 5 to 50 people Complexity: Medium Duration: 1 to 2 years Risk: Moderate Funding: \$500K to \$2M	Level 1: (most rigorous) Size: >50 people Complexity: High Duration: >2 years Risk: Considerable Funding: > \$2M
 Plan and Integrate Your Work (Systems Planning & Integration)	System Boundaries Driving Requirements SE Checklist	System Engineering Management Plan (SEMP) Document Control Log	Risk Mitigation Plans Verification Plans
 Develop Plan to Complete Work (Systems Planning & Integration)	Customer Needs Statement Technical Performance Measures Initial System Hierarchy	Measurable Parameters System Requirements Document Technical Baseline Revision 0	System Requirements Review
 Plan and Integrate Your Work (Systems Planning & Integration)	Document Control Log	Configuration Management Plan Change Control Procedures	Change Control Board Configuration Status Accounting
